Management of steroid-induced neuropsychiatric side effects
involves discontinuing or tapering the implicated agent as
soon as is practical. Additional information will be provided
at the appropriate time.

Recovery can take a few months after discontinuation of the steroid.
Ingraham pioneered the use of cortisone to treat postoperative
cerebral edema in neurosurgical patients in [3], and Kofman
first used prednisone for peritumoral edema from brain
metastases in [4]. Using the lowest possible doses may
reduce the occurrence of these complications. Axial
post-gadolinium T1 images A,B and axial Fluid attenuated
inversion recovery images C,D showing poststeroid B,D
reduction in enhancement, mass effect and edema compared with
presteroids A,C.

The sensitivity of abdominal examination may be limited in patients with you
selective imaging is an important consideration for time and
resource management as well as cost containment. Scholarship
opportunities are made available annually to veterinary
students after their first semester through the Office of
Academic Affairs.
